

Web Books Page Visibility Test Report

Test Objective

The objective of this test is to verify the visibility and availability of key elements on the Web Books login page. The test does **not** assess functionality beyond visibility and interactivity (e.g., enabling/disabling).

Test Scope

- Verify the page title
- Check the presence and visibility of essential login page elements:
 - Email input field
 - Password input field
 - Login button
 - Register button
 - Forgot Password link
- Ensure interactive elements (inputs and buttons) are enabled

Test Execution

The test was executed across multiple browsers and a mobile device using Playwright. The following elements were validated successfully:

- **Page Title:** Confirmed as "Web Books"
- **Email Input:** Visible and enabled
- **Password Input:** Visible and enabled
- **Login Button:** Visible and enabled
- **Register Button:** Visible and enabled
- **Forgot Password Link:** Visible

A full-page screenshot was captured for documentation.

Test Results

The test confirmed that all required elements are **present and visible** across different environments. However, this test does **not** validate functionality (e.g., login process, form submission).

Conclusion

The Web Books login page elements are properly rendered and interactable. Future tests should incorporate functional validations, including login authentication, error handling, and navigation flow.
